For growing seeds indoors either pots or shallow boxes known as flats, are satisfactory. Whichever you use be sure the drainage is good. In the case of flats see that the boards on the bottom are spaced about a quarter of an inch apart. When filling the seed flats place some material such as granulated peat moss along the cracks to prevent the soil from washing through the bottom. On the bottom half inch of the flat place gravel or soil screenings to help the drainage. If pots are used be sure to put some drainage material in the bottoms.

FOR FALL BLOOM

Make an additional sowing of these flowers in mid-summer for fall blooms.

Calendula
Candytuft
California Poppy
Dwarf Marigold
Phlox Drummondii
Sweet Alyssum
Zinnia, Lilliput

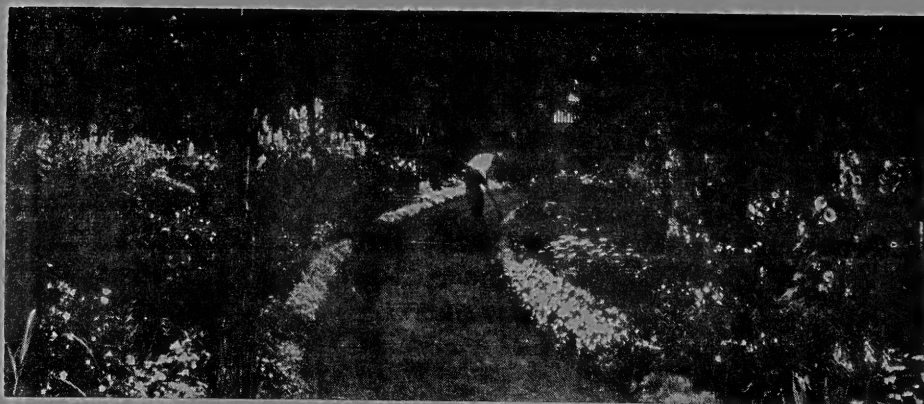

Water the seed bed thoroughly, but gently with a fine spray. A coarse spray or stream of water will wash the seed out of the soil. For this reason, when using an outdoor seed bed, it is well to have a cover available to place over the seed bed during rainy spells. This should be supported several inches over the seed bed to allow free circulation of air.

Be sure to keep the seed bed moist. Excessive dryness will prevent germination.

NASTURTIIUMS

Ever popular plants of the easiest culture, blooming most profusely in ordinary, well-drained garden soil; if overly rich it will cause plants to produce more leaves than flowers. They are most useful plants for dry, sandy, or gravelly locations. Nasturtiums may be had in a great variety of shades and color combinations, single or double flowers and semi-tall or dwarf growing. Their varied colors, different shapes and refreshing fragrance make them most desirable for cutting. Few flowers ever introduced have been acclaimed so quickly and praised so highly as double nasturtiums. The ever popular Golden Gleam was the first double to be grown from seed. Since then we have created double nasturtiums in all the best colors.

Semi-Tall Giant Double Nasturtiums

Flowers are extra large, exquisitely sweet-scented, double and semi-double with eight or more petals; plants are semi-tall and splendid for beds, broad borders or as ground covers. May be trained upon strings or wire. Valuable for cutting, as flowers keep for a long time.

Golden Gleam All-America Gold Medal Winner. Rich golden yellow, sweet-scented long-stemmed flowers. Profuse blooming.

Most attractive in beds, borders, edgings, rock gardens and pots. We offer a wide assortment of the best colors.

GIANT PANSIES

Pansies always have been a great specialty with us and we are justly proud of our strains. Their wide range of colors, markings and forms, their easy culture, have made Burpee pansies universally popular. Pansies succeed best in fairly rich, well-drained soil in a sunny position, and produce their finest flowers in the cool, early days of spring. Keep flowers picked during the summer, plants pinched back, and you will get a nice lot of flowers again in the fall. Seeds may be sown outdoors when soil has become warm; for earlier blooms, start seed indoors or in a warm hotbed six to eight weeks before your usual outdoor planting time.

HYBRID PETUNIAS

Hybrid petunias are really outstanding, each seed is produced by carefully controlled crossing by hand of two distinct parent lines. This is very costly but the resulting seed will produce a hybrid of extreme vigor, more uniform in growth, with larger flowers and considerably more of them per plant than either parent. We strongly urge that special care and attention be given to the sowing of the seed and the growing of the plants. Wonderful for beds, borders and excellent for cut flowers.

Lawn Seed, Fancy Grasses Field Seed

DUTHIE's Lawn Grass Seed

The best time to start your lawn, or to repair it, is during the cool weather of early spring or in early fall. The weather at these times is favorable for the development of domestic grass but unfavorable for most weeds and wild annual grasses. Why not plan now to

have a luxuriant lawn that will add so much to the beauty of your home? The Burpee leaflet, "L 20 - How to Establish a Lawn," will be sent free upon your request. For new lawns, sow 1 lb. of grass seed to 200 sq. ft. of space; use 100 to 150 lbs. per acre.

Best All-Purpose Mixture, especially prepared from the highest quality seeds that can be produced. It makes a smooth, green, velvety lawn with a thick bottom, free from clumps. Only the very best fine-leaved and deep-rooted varieties of the most suitable grasses for making an even, thick mass of sod are used in this mixture. 8- Reasons for Good Seed.

Buy Field Seed Early Is Advice to Farmers

What Makes Good Seed

1. Adapted variety
2. High yield records
3. High quality of crop
4. High seed purity
5. Small total weed seeds
6. Freedom from noxious weeds
7. High germination
8. Freedom from diseases

Everyone knows the biblical warning against building a house on sand, also the folly of spending money on the materials that go into a house and trying to save on a cheap foundation.

But do farmers realize that the same principle applies to the purchase of seed for planting? Good stands of grasses, clovers and other crops come only from good seed.

For 1955 the total supply of 26 important legume and grass seeds is about 14 per cent less than last year and a tenth below the 1943-52 average.

Of the one billion pounds of these about 700 million are those most likely to be sown in the spring, and this is only 7 per cent less than last year and nearly equal to the 10-year average.

Hot, dry weather in many seed-producing sections reduced the harvest but fortunately elsewhere yields were above average. Because of generally favorable weather for harvesting, the quality of the 1954 seed crops is fairly good to good.

Current prices of 11 out of 18 seeds in this spring-sown group are higher than a year ago and than average, and 7 are lower.

Betters Grass Stands

Much high quality grass and clover seed is wasted because of failure to obtain stands under conditions that appear favorable.

Drilling of grass and clover seed at a depth of one-fourth inch and placement of fertilizer in bands one inch below the seed, with the soil packed over the seed, may be an answer to the problem of making better use of our seed supply.

Tests are under way to develop better methods of planting these crops, by the U.S.D.A. at Beltsville, Maryland. The first season's results, as reported in CROPS AND SOILS by R. E. Wagner and W. C. Hulburt, were decidedly favorable to such precision placement of both seed and fertilizer.

Stand when fertilizer is 1 inch below seed.

Poor stand where seed and fertilizer were broadcast same rates.

Stringless Green-Pod BUSH BEANS

How to Grow Bush Snap Beans

Plant seed when danger of frost is past and the soil is warm, in rows 18 to 30 in. apart for hand cultivation or 2½ to 3 ft. apart for field cultivation. Make furrows about 2 in. deep and space the beans 2 to 3 in. apart in the row. Cover with fine soil and firm the soil over the seed with your foot or the back of a rake to insure good germination. When plants are 2 or 3 in. high, thin to stand 4 to 6 in. apart in the row. For a continuous supply of tender pods, make additional sowings when the preceding planting is up and growing; allow plenty of time for the last sowing to bear before frost. Plants grow 15 to 20 in. tall and will bear more pods if you pick them when young at which time they are truly delicious. A pkt. of seed will sow about 25 ft. of row; one lb., 150 ft.

Topcrop — Mosaic resistant; hardy

49 days. All-America Gold Medal Winner. POLE BEANS

Pole beans come into bearing later than bush beans, yield more heavily over a longer period and some produce bigger pods. Support must be given the vines, which grow 5 to 8 ft. and more high. Young pods make delicious snap-shorts; also popular as green or dried shell beans. To many persons, pole beans have that good bean flavor that is lacking in some varieties of the bush type. The most popular and dependable varieties of pole beans are Kentucky Wonder, McCaslan (green-pods) and Kentucky Wonder Wax (yellow-pod). Horticultural is grown largely as a shell bean.

Kentucky Wonder — Brown seeded; round pods

65 days. Most popular and dependable throughout the country. It is early, climbs well, and bears a heavy crop of large, green pods, 7 to 9 in. long, in clusters. They are round, thick, meaty, tender, brittle, excellent for freezing, fairly straight and stringless when young, but become twisted and develop moderate strings later. Though thick, the pods appear slender on account of their length. The light brown seeds have a distinctive, tasty flavor which makes them so highly desirable for use as shell beans. A profitable market snap or dry shelled bean in many sections.

Pkt. 15¢; ½ lb. 40¢; lb. 70¢; 2 lbs. \$1.30; 5 lbs. \$3.00

75 Lazy Wife

(White Cranberry) 80 days. Broad, flat, green pods, 5 to 6 in. long; straight, meaty, brittle and stringless. Fine for snaps when young; green shelled or dry beans are delicious. White seeded; round and smooth. For home and market.

Pkt. 15¢; ½ lb. 40¢; lb. 70¢; 2 lbs. \$1.30; 5 lbs. \$3.00

How to Grow Pole Beans

Pole Beans should not be planted until all danger of frost is passed and the soil is warm and moderately dry. They do best if the vines are given support, the most frequently used being rough poles, spaced 3 to 4 ft. apart each way. Place 5 or 6 beans around each pole, cover with 2 in. of soil, and firm to assist germination. When plants are well started, thin so that 3 or 4 of the strongest remain to a pole. A packet of seed is enough for 15 poles; 1 lb. of seed for 100 poles, except Scarlet Runner, a pkt. of which is enough for 8 poles; 1 lb. for 60 poles. Pole Beans may also be planted 3 to 5 in. apart along a trellis or fence, sowing 300 ft. of row with 1 lb. of seed.

Luxury Limas

LIMAS should be planted with the eye down. The Bush Lima is more easily grown than the tall, and is earlier and more economical of space, but the Pole Limas yield better. One week after frost proof date sow seeds two inches deep, and thin plants of small seeded bush and all pole varieties to stand 6 inches apart, all large seeded bush to stand one foot apart. Plants kept picked clean will bear until frost.

How to Grow Cabbage

For earliest crop, start early and midseason cabbage seed in hotbed or house; for medium early cabbage, seed may be sown in a cold-frame or open-ground seed-bed in early spring. Sow late cabbage for winter use in a seed-bed outdoors when soil has become warm. A pkt., except O-S Cross, will produce about 250 plants; oz. about 2000 plants. Days to maturity are from the time the plants are set in the garden; allow 30 days to produce plants from seed. Cabbage does best in deep, rich, loamy soil and should be given plenty of water during prolonged dry spells. Space early cabbage plants 18 in. apart in rows 2½ ft. apart; the large midseason and late varieties 2 ft. apart in rows 2½ to 3 ft. apart. Cabbage should never be planted in the same location where it, cauliflower, broccoli, or any of the cabbage family, had been planted the previous year. Healthy, solid heads of late cabbage may be stored for winter use.

How to Grow Cantaloupes

The most suitable soil is a rich, warm, sandy loam. Sow the seed after the ground has warmed up, putting 8 to 10 seeds in groups, allowing 2 to 3 in. between the seeds and cover with 1 in. of fine soil. The groups should be spaced 4 to 6 ft. apart each way. Thin to 2 or 3 plants to a group after the plants are well established. Well-rotted manure dug into the soil where seeds are to be planted and side dressings of commercial fertilizer after the plants have begun to grow are usually beneficial. A pkt. will plant 12 groups, 1 oz. 50 groups or so-called "hills"—a term that is misleading to many gardeners.

How to Grow Spinach

Sow seeds very early in the spring, either broadcast or in rows 18 to 24 in. apart; cover the seed with 1 in. of soil and thin plants to stand 5 or 6 in. apart in the rows. At each picking, remove every other plant, which will allow room for remaining plants to fully develop. Additional sowings may be made when the preceding planting is up and growing, but the last should be two months before hot weather is expected. For fall use, sow in late summer; for early spring use, where winters are mild, sow in early fall and cover with a few inches of hay, leaves or litter. A pkt. will sow 25 ft. of row; 1 oz. 75 ft. Directions for growing New Zealand spinach are given on the seed bags.
